

**Manchester's new
Vertical Bump Machine
Model M04-VH-8**

Taking a tube with a 90° bend close to the end, the **M04-VH-8**, *Vertical Bump Machine*, with capacity of 8 strokes, flattens the radius of the tube and completes the end form, creating a lower overall profile.

The **M04-VH-8** may be loaded by hand or by means of automation. If loaded by hand a series of fixtures locates the tube in the precise location allowing the operators to remove themselves from the working environment until completion of end forming operation.
